in acute stroke care to community settings

REGISTER NOW!

After attending this course, clinicians will have a greater understanding of:

- The range of deficits (cognitive, communication, emotional, physical) that can occur after acquired brain injury and the case for multidisciplinary involvement and monitoring.
- Assessment approaches that are comprehensive, collaborative, and contextual in recognition of the fact that deficits may be persistent, subtle, and debilitating.
- Evidence-based approaches to goal setting, treatment, and monitoring of participation in home, community, work, school, and social settings
